

Aggregate Processing Line

Yifan provides you technical support of whole set of aggregate processing equipment. This line includes vibrating feeder, jaw crusher, impact crusher, vibrating feeder, vertical shaft impact crusher, and so on. Together with belt conveyors, it makes up a complete unit of aggregate processing line.

Application:

The line is used to produce aggregate or sand by crushing hard limestone, granite, basalt, river pebbles, and so on. It is applied in these fields of hydropower, building material, expressway, and urban construction.

Flow chart:

Vibrating feeder feeds the material into jaw crusher, and then jaw crusher crushes it primarily. After being crushed into reasonable size, the material will be reshaped and processed by impact crusher. Vertical shaft impact crusher plays the role of tertiary crushing, and then vibrating screen sieves product. Product size is up to the crusher model and screen model.

Performance:

1. High degree of automation
2. High production efficiency, low operating cost, high output, and good profit
3. Adjustable discharging rang, large crushing ratio, and energy-saving

4. Even product size and good shape, which meets the standards of notational expressway
